

WHAT IS CLAIMED IS:

1. An equipment management apparatus for transmitting management information collected from a plurality of equipment to a centralized management apparatus, comprising:

a detector for detecting a trouble which has occurred in first equipment; and

a transmission controller for, when the trouble is detected by the detector, transmitting management information about second equipment which is other than the first equipment together with the trouble information about the first equipment to the centralized management apparatus.

2. An equipment management apparatus according to claim 1, wherein the transmission controller responds to the detection of the trouble by the detector, and obtains the management information from the second equipment.

3. An equipment management apparatus according to claim 1, wherein the transmission controller transmits management information about a plurality of equipment including the second equipment.

4. An equipment management apparatus according

to claim 1 further comprising a selector for selecting the second equipment among the plurality of equipment based on a specified condition.

5 5. An equipment management apparatus according to claim 4, wherein the specified condition is a period until the time for the next regular maintenance for each equipment comes, and the selector selects as second equipment the equipment whose time for the next regular maintenance is scheduled earlier than the times for the
10 next regular maintenance for any other equipment.

 6. An equipment management apparatus according to claim 4, wherein the specified condition is
15 characteristics of each of the equipment, and the selector selects the second equipment based on the characteristics of each of the equipment.

 7. An equipment management apparatus according to claim 1, wherein the equipment is an image forming
20 apparatus for forming an image on a sheet.

 8. An equipment management apparatus according to claim 7, further comprising a selector for selecting
25 the second equipment among a plurality of equipment, based on at least one of the type of color of the image forming apparatus, the speed of image formation thereof, and the

equipment structure thereof.

9. An equipment management apparatus for transmitting management information collected from a plurality of equipment to a centralized management apparatus, comprising:

a first judging device for judging whether or not it is the time of transmitting information about first equipment;

10 a second judging device for judging whether or not it is the time of transmitting information about second equipment;

a priority determining controller for determining the order of priorities of the first and second equipment, based on the characteristics of each of the equipment; and

a transmission controller for transmitting the information about the first and second equipment to the centralized management apparatus, in accordance with the order of priorities determined by the priority determining controller, when the first judging device judges that it is the time of transmitting the information about the first equipment, and the second judging device judges that it is the time of transmitting the information about the second equipment.

10. An equipment management apparatus according

to claim 9, wherein the equipment is an image forming apparatus for forming an image on a sheet.

11. An equipment management apparatus according
5 to claim 10, wherein the priority determining controller determines an order of priorities based on at least one of the type of color of the image forming apparatus, the speed of image formation thereof, and the apparatus structure thereof.

10

12. An equipment management system including an
equipment management apparatus for transmitting
management information collected from a plurality of
equipment, and a centralized management apparatus for
15 managing each of the plurality of equipment based on the management information transmitted from the equipment management apparatus,

wherein the equipment management apparatus comprises:

20 a detector for detecting a trouble which has occurred in first equipment; and

a transmission controller for, when the trouble is detected by the detector, transmitting management information about second equipment which is other than
25 the first equipment together with the trouble information about the first equipment to the centralized management apparatus.

13. An equipment management system including an equipment management apparatus for transmitting management information collected from a plurality of
5 equipment, and a centralized management apparatus for managing each of the plurality of equipment based on the management information transmitted from the equipment management apparatus,

wherein the equipment management apparatus
10 comprises:

a first judging device for judging whether or not
it is the time of transmitting information about first
equipment;

a second judging device for judging whether or not
15 it is the time of transmitting the information about
second equipment;

a priority determining controller for determining
an order of priorities of the first and second equipment,
based on a characteristic of each of the equipment; and

20 a transmission controller for transmitting the
information about the first and second equipment to the
centralized management apparatus, in accordance with the
order of priorities determined by the priority
determining controller, when the first judging device
25 judges that it is the time of transmitting the information
about the first equipment, and the second judging device
judges that it is the time of transmitting the information

about the second equipment.

14. An equipment management method in which one equipment management apparatus collects management
5 information about a plurality of equipment, and the equipment management apparatus transmits the management information to a centralized management apparatus so as to manage the plurality of equipment, comprising steps of:

10 a step 1 of detecting a trouble which has occurred in first equipment by use of the equipment management apparatus; and

a step 2 of transmitting management information about second equipment which is other than the first
15 equipment from the equipment management apparatus to the centralized management apparatus together with the trouble information about the first equipment, when the trouble is detected in the step 1.

20 15. An equipment management method in which one equipment management apparatus collects management information about a plurality of equipment, and the equipment management apparatus transmits the management information to a centralized management apparatus so as
25 to manage the plurality of equipment, comprising steps of:

a step of judging whether or not it is the time

of transmitting information about first equipment from the equipment management apparatus;

5 a step of judging whether or not it is the time of transmitting the information about second equipment from the equipment management apparatus; and

a step of transmitting the information about the first and second equipment from the equipment management apparatus to the centralized management apparatus, in accordance with the order of priorities based on the
10 characteristics of each of the equipment, when it is judged that it is the time of transmitting the information about the first equipment, and it is judged that it is the time of transmitting the information about the second equipment.
